

Immunize your kids!

What is immunization?

Immunization may also be called vaccination, baby shots or needles.

It is the best protection against many serious diseases.

How does it work?

Vaccines trigger your child's own immune system to make antibodies to fight diseases. For immunization to work best, children must have all their vaccinations – on time.

Is it safe?

Immunization is very safe. If you have any concerns, call your doctor or public health office, or go to immunize.ca

What should I do to protect my child?

- ✓ call your doctor or public health office to set up a time for your child's vaccinations
- ✓ keep a written record of all your child's vaccinations

Recommended Vaccines for Kids

Below are the vaccines routinely recommended for children, from infancy to adolescence. These vaccines provide the best protection against serious illness, disability or even death. Most of these vaccines are available at no charge. Check with your doctor or public health office for the specific schedule, doses and possible costs of these vaccines in your province or territory.

DTaP	Diphtheria, tetanus, pertussis (whooping cough) vaccine
IPV	Inactivated poliovirus (polio) vaccine
Hib	<i>Haemophilus influenzae</i> type b conjugate vaccine (meningitis, blood infection)
MMR	Measles, mumps and rubella vaccine
dTap	Tetanus, diphtheria, pertussis adolescent/adult type vaccines
HepB	Hepatitis B vaccine (liver infection)
V	Varicella vaccine (chickenpox)
PC	Pneumococcal conjugate vaccine (meningitis, blood infection, pneumonia, ear infections)
MC	Meningococcal C conjugate vaccine (meningitis, blood infection)
Flu	Influenza vaccine is recommended annually for children aged 6-23 months and for children of any age with chronic health conditions.
HPV	Human Papillomavirus vaccine is recommended for girls and women aged 9-26 years
